IUCN – The World Conservation Union

Founded in 1948, IUCN – The World Conservation Union brings together States, government agencies and a diverse range of non-governmental organizations in a unique world partnership: more than 800 members in all, spread across 126 countries. The Union seeks to work with its members to achieve development that is sustainable and that provides a lasting improvement in the quality of life for people all over the world.

UICN – Union mondiale pour la nature

Fondée en 1948, l'UICN – Union mondiale pour la nature réunit des Etats, des organismes publics et un large éventail d'organisations non gouvernementales en une association mondiale unique: en tout, plus de 800 membres dans 126 pays. L'Union cherche à oeuvrer, en collaboration avec ses membres, à l'avènement d'un développement qui soit durable et améliore de manière permanente la qualité de vie de l'humanité tout entière.

UICN – Unión Mundial para la Naturaleza

Fundada en 1948, la UICN – Unión Mundial para la Naturaleza agrupa a Estados, organismos gubernamentales y una diversa gama de organizaciones no gubernamentales en una asociación mundial única en su género; cuenta en total con unos 800 miembros procedentes de 126 países. La Unión procura trabajar con sus miembros en la consecución de un tipo de desarrollo que sea sostenible, y contribuya a mejorar de forma duradera la calidad de vida de los pueblos de todo el mundo.

World Conservation Monitoring Centre

The World Conservation Monitoring Centre (WCMC) is a joint venture between the three partners who developed the *World Conservation Strategy* and its successor, *Caring for the Earth*: IUCN – The World Conservation Union, UNEP – United Nations Environment Programme, and WWF – World Wide Fund For Nature (formerly World Wildlife Fund). Its mission is to support conservation and sustainable development through the provision of information on the world's biological diversity.

WCMC has developed a global overview database that includes threatened plant and animal species, habitats of conservation concern, critical sites, protected areas of the world, and the utilisation and trade in wildlife species and products. Drawing on this database, WCMC provides an information service to the conservation and development communities, governments and the United Nations agencies, scientific institutions, the business and commercial sector, and the media. WCMC produces a wide variety of specialist outputs and reports based on analyses of its data. It is also actively involved in building the capabilities of other institutions, particularly in developing countries, for promoting and planning their own biological resources.

Le WCMC - Centre mondial de surveillance continue de la conservation de la nature

Le Centre mondial de surveillance continue de la conservation de la nature (WCMC) est une entreprise commune des trois partenaires de la *Stratégie mondiale de la conservation*: l'Union mondiale pour la nature (UICN), le Fonds mondial pour la nature (WWF), et le Programme des Nations Unies pour l'environnement (PNUE). Ce centre a pour mission d'appuyer la conservation et le développement durable en recueillant et en analysant les données mondiales sur la conservation, afin que les décisions concernant les ressources biologiques reposent sur les meilleures informations possibles.

Le WCMC a établi une banque de données sur la diversité biologique mondiale, qui comprend des données sur les espèces animales et végétales menacées, les biotopes préoccupants du point de vue de la conservation, les sites critiques, les aires protégées, ainsi que l'utilisation et le commerce des espèces et produits de la faune et de la flore sauvages. S'appuyant sur cette banque de données, le WCMC fournit un service d'information aux communautés de la conservation et du développement, aux gouvernements, aux institutions des Nations Unies, aux instituts scientifiques, au monde du commerce et des affaires, et aux médias. Le WCMC publie de très nombreux rapports et documents spécialisés, fondés sur l'analyse de ses données.

Centro Mundial de Monitoreo de la Conservación

El Centro Mundial de Monitoreo de la Conservación (WCMC) es una empresa conjunta entre los tres asociados que elaboraron la *Estrategia Mundial para la Conservación* y su sucesor, *Cuidar la Tierra*: la UICN – Unión Mundial para la Naturaleza –, el PNUMA – Programa de las Naciones Unidas para el Medio Ambiente –, y el WWF – Fondo Mundial para la Naturaleza (anteriormente Fondo Mundial para la Vida Silvestre). Su misión es promover la conservación y el desarrollo sustentable a través del suministro de información sobre la diversidad biológica del mundo.

El WCMC ha creado una base de datos mundial sobre especies amenazadas de animales y plantas, habitat de interés para la conservación, sitios de importancia crítica, áreas protegidas del mundo, y sobre la utilización y comercio de especies silvestres y productos derivados. Aprovechando los recursos de esta base de datos, el WCMC proporciona servicios de información a las comunidades dedicadas a la conservación y al desarrollo, los gobiernos y organismos pertenecientes a las Naciones Unidas, a las instituciones científicas, a los sectores empresarial y comercial, y a los medios de comunicación. El WCMC hace una amplia gama de contribuciones y publica informes especializados, basados en el análisis de sus datos. También participa activamente reforzando de las capacidades de otras instituciones, particularmente en los países en vía de desarrollo, con miras a la promoción y planificación de sus propios recursos biológicos.

Introduction

Protected areas make a vital contribution to the conservation of the world's natural and cultural resources. Values range from retention of representative samples of natural regions and the preservation of biological diversity, to the maintenance of environmental stability of surrounding regions. Protected areas can provide an opportunity for rural development and rational use of marginal lands, for research and monitoring, for conservation education, and for recreation and tourism. As a result, most countries have developed systems of protected areas.

However, protected area systems vary considerably from one country to another, depending on needs and priorities, and on differences in legislative, institutional and financial support. Also, the range of services and values that protected areas provide is such that some management objectives are not compatible with others. This has led to the emergence of a wide range of protected area designations and definitions.

The aim of the *UN List* is to provide a definitive list of protected areas meeting certain criteria, which are specified below.

History of the UN List

The *United Nations List of National Parks and Equivalent Reserves* was drawn up at the request of the United Nations following a resolution adopted by the General Assembly at its Sixteenth Session in December 1962 on "Economic Development and Nature Conservation". This resolution served to endorse an earlier resolution (No. 713) of the 27th Session of the UN Economic and Social Council held in 1959, which recognized National Parks and Equivalent Reserves as an important factor in the wise use of natural resources, and led to the compilation of the first *World List of National Parks and Equivalent Reserves*.

IUCN was instrumental in the preparation of the two resolutions, and has since had primary responsibility for the compilation and maintenance of the list. The *UN List* is now prepared jointly by the IUCN Commission on National Parks and Protected Areas, and by the World Conservation Monitoring Centre. The previous edition of the *UN List* was published in 1990. Earlier editions appeared in 1961/2, 1966 (English version 1971), 1972 (addendum to the 1966/71 list), 1973, 1974, 1975, 1980, 1982 and 1985. The present title was adopted in 1982.

The IUCN Commission on National Parks and Protected Areas

IUCN's Commission on National Parks and Protected Areas (CNPPA) is the leading international scientific and technical body concerned with the selection, establishment and management of national parks and other protected areas. Its membership includes more than 500 protected areas professionals from about 120 countries. CNPPA is served by IUCN's Protected Areas Programme in order to promote the establishment of a world-wide network of effectively managed terrestrial and marine protected areas.

During preparation of this edition of the *UN List*, CNPPA has been under the chair of P.H.C (Bing) Lucas of New Zealand with Adrian Phillips of the United Kingdom as Deputy Chair. Organization of the Commission is regional, with 14 regional Vice-Chairs and two thematic Vice-Chairs (marine and mountain protected areas). There are normally two to three regional working sessions a year. Since the last *UN List* was compiled, there have been meetings in Australia, China, Sweden, Dominican Republic, Italy (for the North Africa/Middle East region), and the IV World Congress on National Parks and Protected Areas held in Venezuela also brought together over 1,800 people from all over the world.

The WCMC Protected Areas Data Unit

The Protected Areas Data Unit was established by CNPPA in 1981 to handle the increasing amount of information, and to assist the Commission in preparing publications on protected areas around the world. The unit is now a part of the World Conservation Monitoring Centre, and is based in Cambridge in the United Kingdom. One objective of WCMC's work on protected areas is to be able to provide accurate up-to-date information on individual protected areas and protected area systems of the world to those who need it, or, failing that, to identify where such information can be quickly obtained.

In order to meet this objective, WCMC collaborates with the many agencies around the world that manage protected areas, and with conservationists and scientists who work in this field. Many of the individuals involved are members of CNPPA. WCMC also has a particular responsibility for managing information on Biosphere Reserves and World Heritage Sites (accorded by the MAB Secretariat and the World Heritage Committee respectively), and collaborates with the Ramsar Convention Bureau on sites listed under the Ramsar (Wetlands) Convention.

Criteria for inclusion

There are three criteria which govern whether or not a protected area is included in the *UN List*: size, management objectives, and the authority of the management agency.

1. *Size.* Only protected areas of over 1,000 hectares are included, with the exception of offshore or oceanic islands of at least 100 hectares where the whole island is protected. One thousand hectares is equivalent to 10 square kilometres, 2,471 acres or 3.86 square miles.
2. *Management objectives.* A series of protected area management categories, defined by management objective, are identified by IUCN/CNPPA. These have been revised since the previous *UN List* was published, and definitions of each category are provided below.

Nationally designated sites are allocated to the relevant IUCN Categories, on the basis of their legally defined management objectives, and implementation of those objectives. Where the available information suggests that management of the site is insufficient to implement nationally legislated objectives, the site may either be omitted from the list, or, where relevant, included under another category. Reasons for this might include inappropriate use, inadequate resources, severe encroachment or civil strife, and are often beyond the control of the management authority. It is anticipated that such omission or reclassification would be temporary, pending improvement in the information available, or in the actual on-site situation.

The 1993 edition of the *UN List* includes sites in IUCN Management Categories I through V. It is intended that Category VI sites will be included in the next edition. Protected areas which are also designated Ramsar Sites, World Heritage Sites or Biosphere Reserves, are included both in the national lists and in the lists of areas of international significance.

3. *Authority of the management agency.* In the past, only those sites managed by the "highest competent authority" were included within the *UN List*, i.e. those with the highest appropriate level of government. In this edition of the list, those sites managed by state authorities within the federal systems have also been included.

The 1993 *UN List* is the fourth to be prepared jointly by WCMC and CNPPA, and, as with the previous three lists (published in 1982, 1985 and 1990), there has been a considerable expansion in the list—despite the fact that the criteria for inclusion have remained largely unchanged. While there have been some significant extensions to protected areas networks, much of the expansion of the list is due to improvements in available information, and improvements in our ability to collect and manage it. It is important to bear this in mind when using the list.

Layout of the UN List

Sites which meet the above-mentioned criteria are listed country by country (in alphabetic order of the English-language version of the country name). Within each country, sites are presented in alphabetic order by national designation (for example national parks, nature reserves, wildlife sanctuaries). Three items of information are provided about each site: its IUCN management category, its size (in hectares), and the year it was established (or significantly altered in either size or designation). For the first time, the list also includes a central latitude/longitude for each site. Further information on each of these sites is held by the World Conservation Monitoring Centre.

For practical reasons, the 1993 *UN List* has been ordered according to an alphabetical listing of countries in English. French and Spanish speaking readers should consult the glossaries on pages xxvii to xlvi. These provide a translation of country names from French to English and from Spanish to English, respectively. To assist readers locate specific sections of the *UN List*, an English running head is provided. Similarly, the summary data presented at the start of each country section are entitled and annotated in English only. The equivalent terms are 'Sommaire' and 'Catégorie' in French, and 'Resumen' and 'Categoría' in Spanish.

Compilation of the UN List

WCMC and CNPPA have been collecting and managing information on protected areas for a number of years, and a large body of information is available, some of which has been published. New information is also constantly being received. In preparing the 1993 *UN List*, staff at WCMC reviewed existing material, and revised and updated lists of protected areas (which included the appropriate IUCN Management Category for each site). Draft lists for each country were sent to national management agencies, with a request that they be checked, updated, and returned. Based on the information received, WCMC staff revised this draft, following up queries with contacts in the countries concerned, or members of the CNPPA.

Copies of the revised lists were then sent to the CNPPA Regional Vice-Chairs for review, as well as to the IUCN Secretariat. The responses of national management authorities varied considerably. In total, some 455 requests were made. In the case of federal nations, for example the United States, requests were sent to individual state authorities and in instances where more than one agency is responsible for protected areas, multiple requests were sent to the same country. By October 1993, 226 responses had been received, 49% of the total. The rate of response was best in Australia with an 88% response and poorest in Francophone Africa, with only 18% response. In the event that no information was received from official sources, data were taken, where possible, from published material and other sources.

As detailed above, information for the new *UN List* was gathered from management agencies during the course of 1993. Part of this exercise included providing summary text to each agency, briefly describing the then current IUCN Management Category System, with a request that the appropriate category be applied to each site (a summary of this category system is provided at the end of this introduction). The information presented in the 1993 *UN List* has been classified according to this category system which was in place at the time of data collection.

In mid-1993, a new protected areas management category system was approved by the IUCN Council, on the advice of CNPPA following review at the 1992 Forth World Congress on National Parks and Protected Areas at Caracas. This new system is introduced through the publication of the *Guidelines for Protected Area Management Categories*. The categories used in this new system are also summarised in the Annex. Subsequent editions of the *UN List* will be classified according to this new system.

Accuracy and quality of information

The global system of protected areas is changing rapidly, new areas are created, boundaries of existing areas are revised and some sites are destroyed through industrial development, shifting agriculture, natural disasters or civil strife. To state emphatically that there has been any net gain for conservation in the amount of land and

water protected in the last few years is very difficult. It is not simply a question of hectares protected or of the number of areas protected, but is more a question of management effectiveness. Are the protected areas achieving the objectives for which they were established?

The quality of the information used to compile the *UN List* is very variable, and information on management effectiveness is still lacking for a number of countries. While the vast majority of the national parks which meet the relevant criteria are listed, information on the other categories of protected area is still incomplete, and much more information is necessary before we can be confident we are providing complete lists of areas in every management category. Three important sectors, forestry, private and indigenous, have not been included in the *UN List*, either because their areas do not meet the criteria or because available information is incomplete. Nevertheless, the contribution of these three sectors to conservation and sustainable development is considerable.

Managed areas in the forestry sector cover over 10% of the tropics, according to data collected by WCMC. Throughout the tropics, forestry policy is undergoing substantial change, with increased emphasis being placed on a balanced approach to sustainable production and conservation. However, there is still much to be achieved, and a need exists in many countries to properly assess the conservation value of the forest estate. Following initial review of forest reserves in tropical forest countries, carried out with the support of the UK Overseas Development Administration, WCMC is seeking to continue systematically reviewing the forest reserve systems of all countries to help assess their contribution to nature conservation objectives.

There is some debate on ethical as well as practical grounds as to what extent indigenous areas can be regarded as conservation areas. The importance of these areas for nature conservation cannot be denied, as indigenous areas collectively cover an area the size of Australia, and those correlate strongly with areas of biological richness. For example, Colombia has ceded over 25% of its territory to indigenous peoples, most of this in biologically diverse tropical forest regions. As conservationists are increasingly required to enter into dialogue with indigenous peoples over the joint conservation of cultural and biological diversity, information on indigenous areas will become more important.

Unlike the areas which fall within the other two sectors, private protected areas are not usually significant in terms of the area they cover, but they are important because of the quality of management and degree of protection afforded to them. Private areas include those areas administered by foundations and private enterprise, as well as those established and run by communities themselves. Excellent examples of private initiatives which support and complement state systems abound: The Royal Society for the Protection of Birds in the UK, The Nature Conservancy in North America, the Fundacion Moisés Bertoni in Paraguay and the Royal Society for the Conservation of Nature in Jordan. Private protected areas may increase in importance, particularly in tropical countries, where state resources are very limited.

The 1993 *UN List* undoubtedly includes mistakes and omissions, but it is hoped that these will stimulate ever more accurate information. The responsibility for errors and oversights rests with the compilers, and corrections or updates should be communicated to the:

Protected Areas Data Unit

Acknowledgements

Compilation of the list has been carried out by many WCMC staff, including Graham Drucker, Victoria Freeman, Harriet Gillett, Donald Gordon, Michael Green, Jeremy Harrison (Head of Unit), James Paine (project coordination), Chris Sharpe, Mark Spalding and Alison Suter. Susan Hawley, Tony Rogers, Caroline Brown and Corinna Ravilious have provided tremendous support in the last stages of data entry.

Compilation has been actively supported by CNPPA, and in particular by the officers of the Commission, and Dr James Thorsell, Jeff McNeely, David Sheppard and Caroline Martinet, of the IUCN Secretariat.

The list was prepared for publication by Elaine Shaughnessy and Anne Rodford of the IUCN Publication Services Unit.

Additional financial support was provided by the United Nations Environment Programme.

Finally, many individuals in protected areas management agencies and elsewhere in each country have provided information which has been used in compiling this list. Without this input, the list could not have been completed.

1978 Protected Areas Management Categories

- I. *Strict Nature Reserve/Scientific Reserve.* To protect nature and maintain natural processes in an undisturbed state in order to have ecologically representative examples of the natural environment available for scientific study, environmental monitoring, education, and for the maintenance of genetic resources in a dynamic and evolutionary state.
- II. *National Park.* To protect outstanding natural and scenic areas of national or international significance for scientific, educational, and recreational use. These are relatively large natural areas not materially altered by human activity where extractive resource uses are not allowed.
- III. *Natural Monument/Natural Landmark.* To protect and preserve nationally significant natural features because of their special interest or unique characteristics. These are relatively small areas focused on protection of specific features.
- IV. *Managed Nature Reserve/Wildlife Sanctuary.* To assure the natural conditions necessary to protect nationally significant species, groups of species, biotic communities, or physical features of the environment where these may require specific human manipulation for their perpetuation. Controlled harvesting of some resources can be permitted.
- V. *Protected Landscapes and Seascapes.* To maintain nationally significant natural landscapes which are characteristic of the harmonious interaction of man and land while providing opportunities for public enjoyment through recreation and tourism within the normal life style and economic activity of these areas. These are mixed cultural/natural landscapes of high scenic value where traditional land uses are maintained.

Introduction

Les aires protégées apportent une contribution vitale à la conservation des ressources naturelles et culturelles de la planète. Elles ont aussi bien pour fonction de préserver des échantillons représentatifs de régions naturelles et la diversité biologique que de maintenir la stabilité écologique des régions qui les entourent. Elles sont un moteur pour le développement rural et l'utilisation rationnelle des terres marginales, la recherche et la surveillance continue, l'éducation à la conservation, les loisirs et le tourisme. Pour toutes ces raisons, la plupart des pays se sont dotés d'un réseau d'aires protégées.

Toutefois, les réseaux d'aires protégées varient énormément d'un pays à l'autre, selon les besoins et les priorités, selon les différences entre les moyens législatifs, institutionnels et financiers disponibles. En outre, la gamme des services et valeurs des aires protégées est telle que certains objectifs de gestion sont incompatibles avec d'autres. Une multitude de termes et définitions sont donc appliqués aux aires protégées.

La *Liste des Nations Unies* a pour objectif de donner une liste définitive d'aires protégées répondant à certains critères qui sont spécifiés ci-après.

Histoire de la Liste des Nations Unies

La *Liste des Nations Unies des parcs nationaux et réserves analogues* a été établie selon le vœu des Nations Unies et dans l'esprit d'une résolution sur le "développement économique et la conservation de la nature", adoptée par l'Assemblée générale à sa 16^e Session, en décembre 1962. Cette résolution entérinait une résolution précédente (No 713) de la 27^e Session du Conseil économique et social, tenue en 1959. Cette dernière résolution reconnaissait que les parcs nationaux et réserves analogues sont un instrument important de l'utilisation rationnelle des ressources naturelles et a débouché sur l'établissement de la première *Liste mondiale des parcs nationaux et réserves analogues*.

L'UICN a joué un rôle central dans la préparation des deux résolutions et, depuis lors, est responsable de la compilation et de la mise à jour de la Liste. La *Liste des Nations Unies* est aujourd'hui compilée par la Commission des parcs nationaux et des aires protégées de l'UICN et le Centre mondial de surveillance continue de la conservation de la nature (WCMC). La version précédente de la *Liste des Nations Unies* a été publiée en 1990. De plus anciennes versions datent de 1961/1962, 1966 (version anglaise 1971), 1972 (ajout à la Liste de 1966/1971), 1973, 1974, 1975, 1980, 1982 et 1985. Le titre actuel a été adopté en 1982.

La Commission des parcs nationaux et des aires protégées de l'UICN

La Commission des parcs nationaux et des aires protégées de l'UICN (CPNAP) est le principal organe international, scientifique et technique s'intéressant au choix, à la création et à l'aménagement des parcs nationaux et des aires protégées en général. Elle compte parmi ses membres plus de 500 spécialistes des parcs nationaux et autres aires protégées, de quelque 120 pays. La CPNAP est appuyée par le Programme pour les aires protégées de l'UICN et s'attache à encourager la mise en place et la gestion efficace d'un réseau mondial d'aires protégées terrestres et marines.

Durant la préparation de la présente édition de la *Liste des Nations Unies*, la CPNAP était placée sous la présidence de P.H.C. (Bing) Lucas, de la Nouvelle-Zélande, et sous la vice-présidence d'Adrian Phillips, du Royaume-Uni. La Commission est organisée sur une base régionale. Elle compte 14 vice-présidents régionaux et 2 vice-présidents thématiques (aires protégées marines et montagnardes). Elle tient normalement deux ou trois réunions de travail par an. Depuis la compilation de la dernière *Liste des Nations Unies*, des réunions ont

eu lieu en Australie, en Chine, en Suède, en République dominicaine, en Italie (pour la région Afrique du Nord/Moyen-Orient), et le IV^e Congrès mondial des parcs nationaux et des aires protégées, tenu au Venezuela, a également rassemblé plus de 1800 personnes du monde entier.

L'Unité de données sur les aires protégées du WCMC

L'Unité de données sur les aires protégées a été créée par la CPNAP en 1981, chargée de traiter la quantité croissante de données et d'aider la Commission à préparer des publications sur les aires protégées du monde entier. L'Unité est maintenant intégrée au Centre mondial de surveillance continue de la conservation de la nature et basée à Cambridge, au Royaume-Uni. Les travaux du WCMC concernant les aires protégées visent à fournir des informations précises et à jour sur chaque aire protégée, chaque réseau d'aires protégées, à ceux qui en ont besoin ou, à défaut, de trouver où obtenir rapidement cette information.

Afin d'atteindre cet objectif, le WCMC collabore avec les nombreux organismes qui, dans le monde entier, sont chargés de gérer les aires protégées ainsi qu'avec des spécialistes de la conservation et des scientifiques actifs dans ce domaine. La plupart des personnes concernées sont membres de la CPNAP. Le WCMC est également chargé de gérer l'information sur les réserves de la biosphère et les biens du patrimoine mondial (responsabilités qui lui sont confiées respectivement par le Secrétariat du MAB et le Comité du patrimoine mondial) ainsi que, en collaboration avec le Bureau de la Convention de Ramsar, sur les sites de la Liste de ladite Convention (zones humides).

Critères d'inscription sur la Liste

Trois critères gouvernent l'inscription d'une aire protégée sur la *Liste des Nations Unies*: ses dimensions, les objectifs de gestion et l'autorité de l'organe de gestion.

1. *Les dimensions*: seules sont incluses les aires protégées de plus de 1000 hectares, à l'exception d'îles océaniques qui couvrent au moins 100 hectares, si elles sont entièrement protégées. Mille hectares équivalent à 10 kilomètres carrés.
2. *Les objectifs de gestion*: une série de catégories de gestion pour les aires protégées, définies en fonction de l'objectif de gestion, a été établie par la CPNAP/UICN. Les catégories ont été révisées depuis la publication de la dernière *Liste des Nations Unies*, et les définitions en question sont données ci-après.

Les sites désignés au plan national sont classés dans les catégories appropriées de l'UICN, en fonction de leurs objectifs de gestion définis juridiquement et de la façon dont ces objectifs sont mis en oeuvre. Lorsqu'il est apparent, à travers l'information disponible, qu'un site n'est pas géré de façon à appliquer les objectifs fixés par la législation nationale, ce site peut être omis de la Liste ou, le cas échéant, inclus dans une autre catégorie. Cela peut se produire dans le cas d'utilisation inappropriée du site, de ressources inadéquates, d'empiètement grave ou de guerre civile, événements sur lesquels l'organe de gestion n'a souvent aucune prise. Il est entendu que l'omission ou le reclassement sont temporaires, en attendant de meilleures informations ou une amélioration de la situation sur le terrain.

L'édition 1993 de la *Liste des Nations Unies* inclut les sites des catégories de gestion UICN de I à V. Il est prévu d'ajouter une catégorie VI dans la prochaine édition. Les aires protégées qui sont également des sites Ramsar, des biens du patrimoine mondial ou des réserves de la biosphère figurent à la fois dans les listes nationales et dans les listes d'aires d'importance internationale.

3. *Autorité de l'organe de gestion*: jusqu'à maintenant, seuls étaient inclus dans la *Liste des Nations Unies* les sites gérés par la "plus haute autorité compétente", c'est-à-dire le plus haut organe gouvernemental approprié. La présente édition de la Liste inclut également les sites qui, dans les systèmes fédéraux, sont gérés par des autorités d'Etat.

La *Liste des Nations Unies 1993* est la quatrième que préparent de concert le WCMC et la CPNAP et, comme dans le cas des trois précédentes (publiées en 1982, 1985 et 1990), cette Liste a été

considérablement élargie, bien que les critères d'inscription soient restés largement inchangés. Les réseaux d'aires protégées ont connu une forte expansion mais, en fait, celle de la Liste est due, en grande partie, à l'amélioration des informations disponibles et à une meilleure capacité mise en place pour les recueillir et les gérer. Il importe d'avoir cela présent à l'esprit pour bien utiliser la Liste.

Présentation de la Liste des Nations Unies

Les sites qui satisfont aux critères susmentionnés sont classés pays par pays (dans l'ordre alphabétique du nom anglais du pays). Pour chaque pays, les sites figurent par ordre alphabétique, selon l'appellation nationale (par exemple parcs nationaux, réserves naturelles, sanctuaires de faune sauvage). Pour chaque site, trois éléments d'information sont fournis: la catégorie de gestion selon l'UICN, les dimensions (en hectares) et l'année de création (ou de modification importante des dimensions ou de l'appellation). C'est la première fois que la Liste indique également la latitude/longitude du centre de chaque site. Le WCMC détient de plus amples informations sur tous les sites.

Pour des raisons d'ordre pratique, la *Liste des Nations Unies 1993* classe les pays dans l'ordre alphabétique anglais. Les lecteurs francophones et hispanophones trouveront, dans les lexiques des pages xxvii à xlvi, les noms des pays traduits de français en anglais et d'espagnol en anglais. Pour aider les lecteurs à localiser des sections spécifiques de la Liste, un titre courant générique est fourni en anglais. De même, les données résumées figurant au début de chaque entrée de pays comportent un titre et des annotations en anglais uniquement. Les termes équivalents sont "Sommaire" et "Catégorie" en français et "Resumen" et "Categoría" en espagnol.

Compilation de la Liste des Nations Unies

Le WCMC et la CPNAP rassemblent et traitent des informations sur les aires protégées depuis plusieurs années. Ils disposent donc d'un vaste capital de données dont certaines ont été publiées. Ils reçoivent, en permanence, de nouvelles informations. Pour préparer la *Liste des Nations Unies 1993*, le personnel du WCMC a examiné le matériel existant, révisé et mis à jour des listes d'aires protégées (qui comprenaient la catégorie de gestion UICN appropriée pour chaque site). Des projets de listes de chaque pays ont été envoyés aux organes de gestion nationaux, qui les ont vérifiés et mis à jour. Avec l'information reçue en retour, le WCMC a révisé les projets, résolvant les questions pendantes avec ses contacts dans les pays concernés ou avec les membres de la CPNAP.

Des projets de listes ont été envoyés pour examen aux vice-présidents régionaux de la CPNAP ainsi qu'au secrétariat de l'UICN. Les réponses des organes de gestion nationaux ont été très variées. Au total, environ 455 projets de listes ont été envoyés. Dans le cas des Etats fédéraux, par exemple les Etats-Unis d'Amérique, ces projets ont été envoyés aux autorités d'Etat et, lorsqu'il y avait plus d'un organe responsable des aires protégées, plusieurs copies ont été envoyées dans le même pays. En octobre 1993, 226 réponses avaient été reçues, soit 49% du total. Le meilleur taux de réponse a été enregistré en Australie et le plus faible en Afrique francophone. Pour les pays n'ayant pas envoyé d'information de sources officielles, les données ont, dans la mesure du possible, été puisées dans des publications et autres sources d'information.

Comme cela est précisé ailleurs, les informations destinées à la nouvelle *Liste des Nations Unies* ont été obtenues, en 1993, auprès des organes de gestion. Pour les aider, un texte résumé avait été fourni à chaque organe de gestion, décrivant brièvement le Système de classement alors appliqué par l'UICN, en leur demandant de classer chaque site dans la catégorie appropriée (un résumé de ce système de classement figure à la fin de la présente introduction). Les informations présentées dans la *Liste des Nations Unies 1993* ont donc été classées selon le système en vigueur au moment où les données ont été recueillies.

Au milieu de 1993, un nouveau système de classement a été approuvé par le Conseil de l'UICN, en consultation avec la CPNAP, à l'issue d'un examen effectué par le IVe Congrès mondial des parcs nationaux et des aires protégées, tenu à Caracas en 1992. Ce nouveau système est introduit par la publication des *Lignes directrices pour les catégories de gestion des aires protégées*. Les catégories utilisées dans ce nouveau système

sont également résumées en Annexe. Les futures éditions de la *Liste des Nations Unies* seront classées selon ce nouveau système.

Exactitude et qualité de l'information

Le réseau mondial des aires protégées évolue rapidement: on crée de nouvelles aires, on modifie les limites de celles qui existent tandis que d'autres sont détruites par le développement industriel, l'agriculture itinérante, les catastrophes naturelles ou les conflits civils. Dire franchement que la conservation a fait des progrès ces dernières années, du point de vue de l'augmentation de la superficie terrestre ou aquatique protégée, serait très difficile. Il ne s'agit pas simplement d'hectares protégés ou du nombre d'aires protégées mais plutôt de l'efficacité de la gestion. Les aires protégées remplissent-elles les objectifs qui ont présidé à leur création?

La qualité de l'information qui sert de base à la compilation de la *Liste des Nations Unies* est très variable et l'information sur l'efficacité de la gestion fait encore défaut pour un certain nombre de pays. Alors que la vaste majorité des parcs nationaux remplissant les critères appropriés figure sur la Liste, l'information sur les autres catégories d'aires protégées est encore incomplète et il faudra rassembler encore beaucoup de données avant d'avoir la certitude que les listes sont complètes pour chaque catégorie.

Trois secteurs importants, forestier, privé et autochtone, n'ont pas été inclus dans la *Liste des Nations Unies*, soit parce que leurs superficies ne répondaient pas aux critères, soit parce que les informations disponibles étaient incomplètes. La contribution de ces trois secteurs à la conservation et au développement durable n'en est pas moins considérable.

Selon des données recueillies par le WCMC, les aires gérées du secteur forestier couvrent plus de 10% de la superficie des tropiques. La politique forestière de l'ensemble de cette région est en pleine mutation et s'oriente de plus en plus vers une conception intégrée de la production durable et de la conservation. Il reste cependant encore beaucoup à faire et, dans de nombreux pays, il n'existe aucune estimation précise de la valeur du domaine forestier pour la conservation. Le WCMC, en se fondant sur une première étude des réserves forestières des pays forestiers tropicaux, réalisée avec l'appui de la Overseas Development Administration du Royaume-Uni, s'attache à poursuivre l'examen systématique des réseaux de réserves forestières de tous les pays, afin de les aider à évaluer leur contribution aux objectifs de la conservation de la nature.

La mesure dans laquelle les aires autochtones peuvent être considérées comme des aires de conservation fait l'objet d'une certaine controverse, du point de vue tant éthique que pratique. On ne saurait cependant nier l'importance de ces aires pour la conservation de la nature, étant donné que leur superficie totale équivaut à celle de l'Australie, et qu'elles sont en étroite corrélation avec des zones d'une richesse biologique considérable. Par exemple, la Colombie a cédé aux populations autochtones plus de 25% de son territoire, dont l'essentiel se trouve dans des régions de forêts tropicales caractérisées par une très grande diversité biologique. Plus les défenseurs de la conservation de la nature dialogueront avec les populations autochtones sur la conservation conjointe de la diversité culturelle et biologique, plus il y aura d'information sur les aires autochtones.

Contrairement aux aires des deux autres secteurs, l'importance des aires protégées du secteur privé n'est généralement pas liée à leur superficie, mais à la qualité de leur gestion et au degré de protection dont elles bénéficient. Ces aires privées incluent celles qui sont administrées par des fondations et des entreprises privées, et celles qui ont été établies et sont gérées par les communautés elles-mêmes. Parmi les exemples d'initiatives privées venant appuyer et compléter les systèmes réseaux nationaux, on peut citer: The Royal Society for the Protection of Birds (Royaume-Uni), The Nature Conservancy (Amérique du Nord), la Fundación Moisés Bertoni (Paraguay) et la Royal Society for the Conservation of Nature (Jordanie). L'importance des aires protégées privées est vouée à augmenter, surtout dans les pays tropicaux, où les ressources de l'Etat sont très limitées.

Il va de soi qu'il reste sans doute des erreurs ou des omissions dans la *Liste des Nations Unies 1993*. Nous espérons néanmoins que ces erreurs et omissions nous permettront de recevoir des informations encore plus

précises. Les compilateurs assument l'entière responsabilité de ces erreurs ou omissions et toute correction ou mise à jour devrait leur être communiquée à l'adresse suivante:

Remerciements

La Liste a été compilée par l'ensemble du personnel du WCMC, y compris Graham Drucker, Victoria Freeman, Harriet Gillett, Donald Gordon, Michael Green, Jeremy Harrison (chef de l'Unité), James Paine (coordonnateur de projet), Chris Sharpe, Mark Spalding et Alison Suter. Susan Hawley, Tony Rogers, Caroline Brown et Corinna Ravilious ont été d'une aide très précieuse pour terminer la saisie des données.

La compilation a été activement soutenue par la CPNAP et, en particulier, par les cadres de la Commission, ainsi que par James Thorsell, Jeff McNeely, David Sheppard et Caroline Martinet, du secrétariat de l'UICN.

La Liste a été préparée pour la publication par Elaine Shaughnessy et Anne Rodford du Service des publications de l'UICN.

Un soutien financier complémentaire a été fourni par le Programme des Nations Unies pour l'environnement.

Enfin, de nombreuses personnes, notamment des organes de gestion des aires protégées de chaque pays, ont fourni des informations utilisées pour compiler cette Liste. Sans elles, la Liste n'aurait pu être terminée.

Catégories de gestion des aires protégées de l'UICN (1978)

- I. *Réserve naturelle intégrale/Réserve scientifique.* Protéger la nature et maintenir les processus naturels dans un état non perturbé afin de disposer d'exemples représentatifs du milieu naturel pour les études scientifiques, la surveillance continue de l'environnement, l'éducation et pour le maintien des ressources génétiques dans un état dynamique et évolutif.
- II. *Parc national.* Protéger des régions naturelles et des paysages exceptionnels, d'importance nationale ou internationale, à des fins scientifiques, éducatives et récréatives. Ce sont des aires naturelles relativement vastes, non altérées par les activités de l'homme, où l'exploitation extractive des ressources n'est pas autorisée.
- III. *Monument naturel/Élément naturel marquant.* Protéger et préserver des éléments naturels d'importance nationale en raison de leur intérêt particulier ou de leurs caractéristiques uniques. Ce sont des régions relativement petites où la protection est axée sur des éléments spécifiques.
- IV. *Réserve naturelle dirigée/Sanctuaire de faune.* Garantir le maintien des conditions naturelles nécessaires pour protéger des espèces, groupes d'espèces, communautés biologiques ou traits physiques d'importance nationale lorsque leur perpétuation peut nécessiter une intervention spécifique de l'homme. Un prélèvement contrôlé de certaines ressources peut être autorisé.
- V. *Paysages terrestres et marins protégés.* Maintenir des paysages naturels d'importance nationale, caractéristiques de l'interaction harmonieuse entre l'homme et la terre, tout en donnant au public la possibilité de jouir, par des activités de loisirs et de tourisme, du mode de vie normal et de l'activité économique de ces régions. Ce sont des paysages mixtes, naturels et culturels ayant une valeur esthétique élevée où les modes traditionnels d'utilisation des sols sont maintenus.

Introducción

Las áreas protegidas aportan una contribución vital a la conservación de los recursos naturales y culturales del mundo. Sus funciones varían desde la preservación de ejemplos representativos de regiones naturales y de la diversidad biológica, hasta el mantenimiento de la estabilidad ecológica de las zonas que las rodean. Las áreas protegidas pueden consistir una oportunidad para el desarrollo rural y la utilización de tierras marginales a nivel regional, para la investigación y el monitoreo, para la educación en materia de conservación, y para la recreación y el turismo. Por todas estas razones, la mayoría de países ha establecido sistemas de áreas protegidas.

Sin embargo, los sistemas de áreas protegidas varían enormemente de un país a otro, en función de las necesidades y prioridades, y según el nivel de apoyo legislativo, institucional y financiero que reciben. Asimismo, la gama de servicios y valores de las áreas protegidas es tal, que ciertos objetivos de manejo son incompatibles con otros. Ello ha conducido a aplicar a las áreas protegidas toda una serie de designaciones y definiciones.

La finalidad de la *Lista de las Naciones Unidas* es obtener un listado definitivo de las áreas protegidas que cumplan con determinados criterios, los cuales se presentan más adelante.

Historia de la Lista de las Naciones Unidas

La *Lista de las Naciones Unidas de Parques Nacionales y Reservas Equivalentes* se elaboró atendiendo la solicitud de las Naciones Unidas siguiendo una Resolución sobre "Desarrollo Económico y Conservación de la Naturaleza", adoptada por la Asamblea General en su 16ava Sesión, celebrada en Diciembre de 1962. Esta Resolución sirvió para apoyar una resolución anterior (No. 713) de la 27ava Sesión del Consejo Económico y Social de las Naciones Unidas, celebrada en 1959; esta resolución reconocía la importancia de los parques nacionales y las reservas equivalentes como instrumento para la utilización racional de los recursos naturales, y condujo a la elaboración de la primera *Lista Mundial de Parques Nacionales y Reservas Equivalentes*.

La UICN desempeñó un papel crucial en la preparación de las dos Resoluciones, y desde entonces ha sido la principal responsable de la compilación y actualización de la Lista. Actualmente la Comisión de Parques Nacionales y Areas Protegidas de la UICN junto con el Centro Mundial de Monitoreo de la Conservación, se encarga de preparar la *Lista de las Naciones Unidas*. La edición anterior de la *Lista de las Naciones Unidas* fue publicada en 1990. Previamente se publicaron otras versiones en 1961/1962, 1966 (versión inglesa, 1971), 1972 (adenda a la Lista de 1966/1971), 1973, 1974, 1975, 1980, 1982 y 1985. El título actual se adoptó en 1982.

La Comisión de Parques Nacionales y Areas Protegidas de la UICN

La Comisión de Parques Nacionales y Areas Protegidas (CPNAP) de la UICN es el principal órgano internacional de carácter científico y técnico encargado de la selección, del establecimiento y del manejo de parques nacionales y otras áreas protegidas. Entre sus miembros figuran más de 500 especialistas en áreas protegidas, procedentes de unos 120 países. La CPNAP cuenta con los servicios del Programa de Areas Protegidas de la UICN, con miras a promover el establecimiento y la gestión eficaz de una red mundial de áreas terrestres y marinas protegidas.

Durante la elaboración de la presente edición de la *Lista de las Naciones Unidas*, la CPNAP estuvo presidida por el Sr. P.H.C. (Bing) Lucas de Nueva Zelanda, y el Sr. Adrian Phillips del Reino Unido actuó como

Presidente Adjunto. La Comisión está organizada sobre una base regional, y cuenta con 14 vicepresidentes regionales y dos vicepresidentes de programas temáticos (áreas protegidas, marinas y de montaña). Por lo general se celebran dos o tres reuniones regionales al año. Desde que se compiló la última *Lista de las Naciones Unidas*, se han celebrado reuniones en Australia, China, Suecia, República Dominicana, Italia (para la región de África del Norte/Medio Oriente), y ha tenido lugar en Venezuela el IV Congreso Mundial de Parques Nacionales y Áreas Protegidas, al que asistieron más de 1.800 participantes procedentes de todo el mundo.

Unidad de Datos sobre Áreas Protegidas del WCMC

La Unidad de Datos sobre Áreas Protegidas fue creada por la CPNAP en 1981, con el fin de procesar el creciente volumen de información disponible y ayudar a la Comisión a preparar publicaciones sobre las áreas protegidas en todo el mundo. Actualmente la Unidad forma parte del Centro Mundial de Monitoreo de la Conservación, con base en Cambridge, Reino Unido. Uno de los objetivos de la labor del WCMC en materia de áreas protegidas es proporcionar información actualizada y precisa sobre áreas protegidas individuales y sobre los sistemas de áreas protegidas del mundo a todos los que la necesiten o, si no se dispone de ella, averiguar dónde puede obtenerse rápidamente.

Con el fin de lograr este objetivo, el WCMC colabora con los numerosos organismos de todo el mundo que se dedican a la gestión de las áreas protegidas, así como con los especialistas en conservación y los científicos activos en esta esfera. Muchas de las personas interesadas son miembros de la CPNAP. El WCMC también tiene una responsabilidad especial en cuanto al procesamiento de la información sobre Reservas de la Biosfera y Sitios del Patrimonio Mundial (responsabilidad que le ha sido asignada por la Secretaría del MAB y el Comité del Patrimonio Mundial, respectivamente), y colabora con la Mesa Directiva de la Convención de Ramsar (de Humedales) en relación con los sitios enumerados en dicha Convención.

Criterios para la inclusión

Hay tres criterios en función de los cuales se determina la inclusión de un área protegida en la *Lista de las Naciones Unidas*: su tamaño, los objetivos de manejo y la autoridad del organismo de gestión.

1. *Tamaño.* Sólo se incluyen áreas de más de mil hectáreas, con excepción de las islas extracostas u oceánicas de por lo menos 100 hectáreas, en cuyo caso se confiere protección a la totalidad de la isla. Mil hectáreas equivalen a 10 km², 2.471 acres o 3,86 millas cuadradas.
2. *Objetivos de manejo.* La UICN/CPNAP ha identificado una serie de categorías de manejo de áreas protegidas, definidas en función del objetivo de las actividades de manejo. Estas categorías se han revisado después de que se publicó la última *Lista de las Naciones Unidas*, y más adelante se presentan las definiciones correspondientes a cada una de ellas.

Los sitios designados a nivel nacional se clasifican en las Categorías pertinentes de la UICN, en función de sus objetivos de manejo definidos jurídicamente y de la manera como se tratan de alcanzar esos objetivos. Cuando la información disponible indica que el manejo del sitio no basta para realizar los objetivos fijados por la legislación nacional, el sitio se puede suprimir de la Lista o, cuando proceda, se puede incluir en otra categoría. Entre las razones para adoptar esta decisión se tiene una utilización inadecuada, insuficiencia de recursos, invasión grave o conflicto civil, factores que a menudo están fuera del control del órgano de gestión. Queda entendido que dicha supresión o reclasificación puede ser temporal, en espera de recibir información más detallada o de se mejore la situación en el terreno.

La edición de 1993 de la *Lista de las Naciones Unidas* incluye los sitios que figuran en las Categorías de Manejo I a V de la UICN. Se pretende incluir en la próxima edición los sitios de la Categoría VI. Las áreas protegidas que son igualmente Sitios de Ramsar, Sitios del Patrimonio Mundial o Reservas de la Biosfera, figuran tanto en las listas nacionales como en las listas de áreas de importancia internacional.

3. *Autoridad del organismo de gestión.* En el pasado sólo se incluían en la *Lista de las Naciones Unidas* los sitios administrados por la "más alta autoridad competente", esto es, el máximo órgano gubernamental competente. En esta versión también se han incluido en la Lista los sitios de cuya administración se encargan autoridades estatales en el marco de sistemas federales.

La *Lista de las Naciones Unidas* de 1993 es la cuarta que preparan conjuntamente el WCMC y la CPNAP y, como en el caso de las tres listas precedentes (publicadas en 1982, 1985 y 1990), ésta se ha ampliado notablemente, aunque los criterios de inscripción hayan permanecido en su mayor parte inalterados. Aunque las redes de áreas protegidas se han extendido considerablemente, la ampliación de la Lista obedece en gran parte a la mejora de la información disponible, y a nuestra mayor capacidad para compilar y procesar los datos. Al utilizar la Lista es importante tener en cuenta este aspecto.

Formato de la Lista de las Naciones Unidas

Los sitios que satisfacen los criterios antes mencionados se clasifican país por país (siguiendo el orden alfabético del nombre del país en inglés). Para cada país, los sitios figuran en orden alfabético según la designación nacional (por ejemplo, parques nacionales, reservas naturales, santuarios de vida silvestre). Para cada sitio se proporciona tres tipos de información: su categoría de manejo según la UICN, su dimensión (en hectáreas) y el año de creación (o de modificación importante en tamaño o designación). En esta lista también se proporciona por primera vez una latitud/longitud central para cada sitio. El Centro Mundial de Monitoreo de la Conservación posee información más detallada sobre cada uno de estos sitios.

Por razones prácticas, la *Lista de las Naciones Unidas* de 1993 se ha ordenado siguiendo el listado de los países en inglés, por orden alfabético. Los lectores de lengua francesa y española deberán consultar los glosarios que figuran en las páginas xxvii a xlvi; éstos contienen una traducción de los nombres de los países del francés al inglés y del español al inglés, respectivamente. Para ayudar a los lectores a ubicar secciones específicas de la Lista, se proporciona una secuencia de encabezamientos en inglés. Análogamente, los datos resumidos que figuran al comienzo de cada sección nacional se titulan y anotan en inglés únicamente. Los términos equivalentes son "Sommaire" y "Catégorie" en francés, y "Resumen" y "Categoría" en español.

Compilación de la Lista de las Naciones Unidas

El WCMC y la CPNAP vienen compilando y procesando información sobre áreas protegidas desde hace varios años, y actualmente se cuenta con una cantidad importante de información, parte de la cual ha sido publicada. El Centro y la Comisión reciben constantemente nuevas informaciones. Al preparar la *Lista de las Naciones Unidas* de 1993, el personal del WCMC analizó el material existente y revisó y actualizó las listas de áreas protegidas (que incluyen la correspondiente Categoría de Manejo de la UICN para cada sitio). Los borradores de las listas de cada país se enviaron a los órganos nacionales encargados de la gestión, junto con una petición para que fueran verificados, actualizados y devueltos. Sobre la base de la información recibida, el personal del WCMC revisó esas listas preliminares, resolviendo las cuestiones pendientes a través de sus contactos en los países interesados o con los miembros de la CPNAP.

Se envió copia de las listas revisadas, tanto a los Vicepresidentes Regionales de la CPNAP, como a la Secretaría de la UICN para sus comentarios. Las respuestas de los órganos nacionales de gestión fueron muy variadas. Se formularon en total unas 455 peticiones. En el caso de las naciones federales, como los Estados Unidos, las peticiones se enviaron a las diferentes autoridades estatales, y en los casos en los cuales la responsabilidad de las áreas protegidas corresponde a más de un organismo, se enviaron múltiples peticiones al mismo país. En Octubre de 1993 se habían recibido 226 respuestas, es decir el 49% del total de peticiones. El mayor número de respuestas provino de Australia con un 88% de respuesta y el menor de Africa francóparlante con sólo el 18% de respuesta. Cuando no se recibió información de fuentes oficiales, los datos se extrajeron, siempre fue posible, de materiales publicados y de otras fuentes.

Como se indica en otra sección del presente documento, durante 1993 se compiló información de los organismos encargados de la gestión para elaborar la nueva Lista de las Naciones Unidas. Como parte de ese ejercicio, se proporcionó a cada uno de esos organismos un texto con una descripción sucinta del actual Sistema de Categorías de Manejo de la UICN, junto con la petición de que se aplicase a cada sitio la categoría pertinente (al final de esta introducción se presenta un resumen de ese sistema de categorías). La información contenida en la Lista de las Naciones Unidas ha sido clasificada con base en ese sistema de categorías, que ya se había establecido en el momento de compilar los datos.

A mediados de 1993 el Consejo de la UICN, atendiendo el concepto de la CPNAP tras un análisis efectuado en el IV Congreso Mundial de Parques Nacionales y Áreas Protegidas, aprobó un nuevo sistema de categorías de manejo de áreas protegidas. Este sistema se introduce a través de la publicación de las *Directrices sobre las Categorías de Manejo de Áreas Protegidas*. Las categorías utilizadas en este nuevo sistema también se resumen en el Anexo. Las ediciones ulteriores de la Lista de las Naciones Unidas se clasificarán de conformidad con este nuevo sistema.

Exactitud y calidad de la información

El sistema mundial de áreas protegidas está evolucionando rápidamente: se crean nuevas áreas, se modifican las fronteras de las existentes, y algunos sitios son destruidos por el desarrollo industrial, la agricultura itinerante, los desastres naturales o las guerras civiles. Sería muy difícil asegurar firmemente que en los últimos años la conservación ha hecho progresos netos en lo que respecta a la superficie de tierras o aguas protegidas. No se trata simplemente de las hectáreas protegidas o del número de áreas protegidas, sino más bien de la eficacia de las actividades de manejo. ¿Están alcanzando las áreas protegidas los objetivos para los cuales se crearon?

La calidad de la información utilizada para compilar la *Lista de las Naciones Unidas* es muy variable, y aún se carece de información sobre la eficacia de la gestión en varios países. Aunque en la Lista figura la gran mayoría de los parques nacionales que satisfacen los criterios pertinentes, la información sobre las otras categorías de áreas protegidas sigue siendo incompleta, y habrá que obtener muchos más datos para tener la certeza de que las listas están completas para cada categoría de manejo. En la *Lista de las Naciones Unidas* no se han incluido las áreas de tres importantes sectores, a saber, el forestal, el privado y las reservas indígenas ya sea porque las áreas correspondientes no satisfacen los criterios, o bien porque la información disponible es incompleta. No obstante, la contribución de estos tres sectores a la conservación y al desarrollo sustentable es considerable.

De conformidad con los datos compilados por el WCMC, las áreas manejadas en el sector forestal cubren más del 10% de las regiones tropicales. En todas estas regiones tropicales la política forestal se está modificando radicalmente, y se está haciendo cada vez mayor hincapié en un enfoque equilibrado para la producción y conservación sustentables. Sin embargo, aún queda mucho por hacer, y es necesario que muchos países evalúen debidamente el valor de sus bosques desde el punto de vista de la conservación. Tras un análisis inicial de las reservas forestales de los países que poseen bosques tropicales, llevada a cabo con el apoyo de la Administración para el Desarrollo de Ultramar (Overseas Development Administration) del Reino Unido, el WCMC sigue trabajando con miras al análisis sistemático de los sistemas de reservas forestales de todos los países, con el fin de ayudar a evaluar su contribución a los objetivos de conservación de la naturaleza.

Por razones éticas y prácticas, existe cierta divergencia de opiniones, respecto de la medida en la cual las reservas indígenas pueden ser consideradas como áreas de conservación. La importancia que revisten estas áreas para la conservación de la naturaleza es incuestionable, dado que las reservas indígenas cubren en conjunto una superficie del tamaño de Australia, y en general corresponden marcadamente a regiones de gran riqueza biológica. Colombia, por ejemplo, ha cedido más del 25% de su territorio a las poblaciones autóctonas, y la mayoría de esas tierras se encuentran en regiones de bosques tropicales con gran diversidad biológica. Dado que cada vez es más necesario que los encargados de la conservación entablen un diálogo con las poblaciones autóctonas, con miras a la conservación conjunta de la diversidad cultural y biológica, la información sobre las reservas indígenas es cada vez más importante.

A diferencia de las áreas que caen dentro del ámbito de los otros dos sectores mencionados, normalmente las áreas protegidas del sector privado no son significativas en cuanto a la superficie que cubren, pero son importantes a causa de la calidad del manejo y del grado de protección que se les confiere. Las áreas privadas comprenden zonas administradas por fundaciones y empresas privadas, así como las establecidas y manejadas por las propias comunidades. Hay numerosos ejemplos notables de iniciativas privadas que sirven de apoyo y complemento a los sistemas estatales: The Royal Society for the Protection of Birds en el Reino Unido, The Nature Conservancy en América del Norte, la Fundación Moisés Bertone en Paraguay y la Royal Society for the Conservation of Nature en Jordania. La importancia de las áreas protegidas de propiedad privada puede ir en aumento, especialmente en los países tropicales, en los cuales los recursos estatales son muy limitados.

Sin duda alguna la *Lista de las Naciones Unidas* de 1993 incluye errores y omisiones, pero se espera que éstos sirvan para estimular el envío de informaciones más precisas. Los editores asumen la responsabilidad de esos errores y omisiones, y ruegan que cualquier corrección o actualización se comunique a:

Agradecimientos

La Lista ha sido compilada por numerosos miembros del personal del WCMC, incluyendo a Graham Drucker, Victoria Freeman, Harriet Gillett, Donald Gordon, Michael Green, Jeremy Harrison (Presidente de la Unidad), James Paine (coordinación del proyecto), Chris Sharpe, Mark Spalding y Alison Suter. Susan Hawley, Tony Rogers, Caroline Brown y Corinna Ravilious han contribuido enormemente en las últimas etapas de la introducción de datos.

En la preparación se ha contado con el apoyo activo de la CPNAP, y en particular de los altos funcionarios de la Comisión y del Dr. James Thorsell, Jeff McNeely, David Sheppard y Caroline Martinet, de la Secretaría de la UICN.

La lista ha sido preparada para su publicación por Elaine Shaughnessy y Anne Rodford, de la Unidad de Servicios de Publicación de la UICN.

El Programa de las Naciones Unidas para el Medio Ambiente aportó apoyo financiero adicional.

Por último, numerosos particulares de los organismos encargados de la gestión de las áreas protegidas en cada país y de otras fuentes, han proporcionado información utilizada para la elaboración de la Lista y sin la cual ésta no habría podido terminarse.

Categorías de Manejo de Areas Protegidas de 1978

- I. *Reserva Natural Estricta/Reserva Científica.* Su fin es proteger la naturaleza y mantener inalterados los procesos naturales, con el objeto de contar con ejemplos ecológicamente representativos del medio ambiente natural, para fines científicos, de monitoreo ambiental, de educación y de mantenimiento de los recursos genéticos en un estado dinámico y evolutivo.
- II. *Parque Nacional.* Su fin es proteger áreas naturales y escénicas sobresalientes de importancia nacional o internacional para usos científicos, educativos y recreativos. Son áreas relativamente grandes que no han sido sustancialmente alteradas por la actividad humana, y donde no se permite la utilización de recursos naturales con fines extractivos.
- III. *Monumento Natural.* Su fin es preservar y proteger elementos naturales específicos de relevancia nacional, debido a sus características únicas o su interés especial. Estas áreas son relativamente pequeñas y están enfocadas a la protección de rasgos naturales específicos.
- IV. *Reserva Natural Manejada/Santuario de Vida Silvestre.* Su fin es garantizar las condiciones naturales necesarias para proteger especies de relevancia nacional, grupos de especies, comunidades bióticas o características físicas del medio ambiente cuando estos requieran de manipulación artificial humana para su perpetuación. El aprovechamiento controlado de algunos de sus recursos naturales puede permitirse.
- V. *Paisajes Terrestres o Marinos Protegidos.* Su fin es mantener paisajes de relevancia nacional, que sean característicos de una interacción armónica entre el hombre y la tierra a la vez que proveer oportunidades de goce público a través de la recreación y del turismo, dentro del contexto del estilo de vida local y de las actividades económicas propias del sitio. Son áreas que contienen un mosaico de paisajes naturales y culturales de gran calidad escénica y donde se mantienen los usos tradicionales del suelo.

Analysis of Information

Analyse de l'information

Análisis de la información

Analysis of Information

All of the information provided in this *UN List* is stored within a computer database, and a wide range of other information is held about each site (and about many other sites not covered here). Some of this information will be analysed in publications by WCMC and IUCN staff. As an indication of this analytic capability, two graphs and two tables have been included within the *UN List*.

Growth of the world coverage of protected areas

Two graphs are provided, one illustrating growth in the number and area of protected areas with time (Figure 1), and the other illustrating growth in the number and area within each five year period (Figure 2). It should be noted that establishment of the Northeast Greenland National Park in 1974 (97 million hectares), the Great Barrier Reef Marine Park in 1979 (35 million hectares) and Jiang Tang Nature Reserve in 1990 (24 million hectares) have a very significant effect on the graphs, as these sites are at least an order of magnitude larger than most others on the *UN List*.

Biogeography

As in the previous four editions of the list each of the areas has been located within one of the biogeographical provinces defined by Udvardy (1975), although the province concerned is not actually identified within this list. Of the 9,832* protected areas qualifying for inclusion in the *UN List*, the Udvardy province is known for 8,562. The remaining 1,270 sites include a number of marine areas which cannot be classified within the Udvardy system. The system of biogeographical provinces of the world defined by Udvardy for IUCN divides the world into eight realms, subdivided into 193 provinces, with each province being characterised by one of 14 biome types. This information is used to provide a crude analysis of coverage both by province, and by biome type.

Table 1 provides a summary of protected area coverage (number of sites and total area) of each of the realms and provinces recognised by Udvardy. Approximately 25% of biogeographical provinces appear to have more than 10% of their area within protected areas. However, when analysing this data various limitations of the system must be considered, resulting both from its relative crudity, and, for example, differences in size between provinces. A 5,000 hectare protected area in the relatively small Malagasy Thorn Forest province, for example, would protect a much larger section of that province than an equivalent sized reserve in the huge Somalian province. A number of provinces appear to have 100% or more protection; this is usually due to marine protected areas being included, whilst the extent of the provinces is based on terrestrial area alone. While the results are sufficient to illustrate patchy coverage, more detailed analysis is necessary to determine real needs and priorities.

Table 2 provides a summary of protected area coverage (number of sites and total area) by biome type, indicating the proportion of each biome type protected within each realm. This ranges from as low as 0.69% in temperate grasslands, to a little under 10% in mixed island systems.

Summarisation of coverage by biome gives a first approximation of how well the major ecological formations are protected, although there is, of course, considerable variation of protection within biomes. It is important to appreciate that biome type does not mean the same as habitat type; a protected area within a tropical humid forest biome may not necessarily contain tropical humid forest, and an area containing tropical humid forest could occur in another biome altogether (such as mixed island systems). Note in this regard that Udvardy identifies all of Indonesia, Sabah and Sarawak and the Philippines as mixed island systems rather than tropical

humid forest. Also, as was noted above for provinces, it is important to realise that there are significant differences between the areas covered by different biome types. For example, in the Neotropics there are extensive areas covered by the tropical humid forest biome (about a quarter of the continent), but only a small area covered by the lake systems biome (Lake Titicaca on the Peru/Bolivia border).

Summary		
Category I	1,460	86,473,325
Category II	2,041	376,784,187
Category III	250	13,686,191
Category IV	3,808	308,314,011
Category V	2,273	141,091,932
Total	9,832	926,349,646

*In a number of cases, a protected area may be located within another. In these instances, the summary totals may be inflated. In the case of the USA, wilderness areas in National Park Service and in Fish and Wildlife Service properties have been excluded from the summary data and analyses, due to their very large size.

Analyse de l'information

Toute l'information donnée dans la *Liste des Nations Unies* est stockée dans la base de données informatisée du WCMC qui détient beaucoup d'autres informations sur chaque site (et sur beaucoup d'autres sites ne figurant pas dans la Liste). Une partie de cette information sera analysée dans des publications, par le personnel du CMSC, entre autres. Deux graphiques et deux tableaux présentant cette capacité analytique ont été inclus dans la *Liste des Nations Unies*.

Expansion de la superficie mondiale des aires protégées

Les deux graphiques illustrent, respectivement l'augmentation du nombre et de la superficie des aires protégées dans le temps (Figure 1) et l'augmentation du nombre et de la superficie par période de cinq ans (Figure 2). Il convient de noter que la création du Parc national du Nord-Est du Groenland, en 1974 (97 millions d'hectares), du Parc marin du Récif de la Grande-Barrière en 1979 (35 millions d'hectares) et de la Réserve naturelle de Jiang Tang en 1990 (24 millions d'hectares) a eu un effet très marqué sur les graphiques, car l'ordre de grandeur de ces sites est pour le moins supérieur à celui de la plupart des autres sites de la *Liste des Nations Unies*.

Biogéographie

Comme dans les quatre éditions précédentes de la Liste, chacune des aires a été replacée dans une des provinces biogéographiques définies par Udvardy (1975), même si la province en question n'est pas réellement identifiée dans cette Liste. Sur les 9832* aires protégées répondant aux critères d'inscription sur la Liste des Nations Unies, 8562 correspondent à des provinces reconnues par Udvardy. Les 1270 sites restants comprennent un certain nombre d'aires marines qui ne rentrent pas dans le réseau défini par Udvardy. Le système mondial de provinces biogéographiques défini par Udvardy pour l'UICN divise le monde en huit domaines, subdivisés en 193 provinces, chacune étant caractérisée par un des 14 types de biomes. Cette information est utilisée pour donner une analyse brute de la couverture par province et par type de biome.

Le Tableau 1 propose un résumé de la couverture des aires protégées (nombre de sites et superficie totale) de chacun des domaines et provinces reconnus par Udvardy. Environ 25% des provinces biogéographiques ont plus de 10% de leur superficie incluse dans des aires protégées. Toutefois, dans l'analyse de ces données, il convient de prendre en considération diverses limites du système, venant à la fois de sa simplicité relative et, par exemple, de dimensions différentes entre les provinces. Une aire protégée de 5000 hectares dans la province relativement petite de la forêt épineuse malgache, par exemple, protège une plus grande proportion de cette province qu'une réserve de taille équivalente dans l'immense province somalienne. Plusieurs provinces semblent bénéficier d'un degré de protection de 100%, voire davantage; cela est généralement dû au fait que les aires protégées marines sont incluses, cependant que l'étendue des provinces est exclusivement fondée sur les terres émergées. Alors que les résultats sont suffisants pour illustrer une couverture en "patchwork", une analyse plus précise est nécessaire pour déterminer les besoins et les priorités réels.

Le Tableau 2 propose un résumé de la couverture des aires protégées (nombre de sites et superficie totale) par type de biome, et indique quelle proportion de chaque type de biome est protégée dans chaque domaine. Celle-ci s'échelonne entre 0,69%, dans les prairies tempérées, et un peu plus de 10%, dans les systèmes insulaires mixtes.

Le résumé de la couverture par biome donne un premier aperçu de la protection réelle des principales formations écologiques bien qu'il y ait, naturellement, des variations considérables dans le degré de protection à l'intérieur de chaque biome. Il importe de retenir que "type de biome" n'a pas le même sens que "type

d'habitat"; une aire protégée se trouvant dans un biome de forêt humide tropicale ne contient pas nécessairement de forêt humide tropicale et une aire contenant une forêt humide tropicale peut se trouver dans un biome tout à fait différent (par exemple, un système insulaire mixte). A cet égard, il convient de noter qu'Udvardy identifie l'ensemble de l'Indonésie, du Sabah, du Sarawak et des Philippines à des systèmes insulaires mixtes et non pas à des biomes de forêts humides tropicales. De plus, comme nous l'avons déjà mentionné pour les provinces, il importe de savoir qu'il y a des différences marquées entre les aires couvertes par différents types de biomes. Par exemple, dans la région néotropicale, de vastes zones sont couvertes par le biome de forêt tropicale humide (environ un quart du continent) alors qu'une seule région, de faibles dimensions, est incluse dans le biome des systèmes lacustres (le lac Titicaca, à la frontière du Pérou et de la Bolivie).

Total	9,832	926,349,646

*Il arrive qu'une aire protégée en englobe une autre, ce qui peut donner lieu à un total cumulé excessif. Aux Etats-Unis, par exemple, les aires de nature sauvage qui sont la propriété du *National Park Service* et du *Fish and Wildlife Service* ont été délibérément exclues des données et analyses récapitulatives, en raison de l'importance de leur superficie.

Análisis de la información

Toda la información suministrada en esta lista de las Naciones Unidas es almacenada en una base de datos computarizada, la cual incluye además una amplia gama de información adicional sobre cada sitio, así como sobre muchos otros sitios no cubiertos aquí. Parte de ésta información será analizada en publicaciones elaboradas por el personal del WCMC y de la UICN. Como indicación de esta capacidad analítica, se han incluido dos gráficos y dos tablas en la lista de las Naciones Unidas.

Expansión de la superficie mundial de áreas protegidas

Se suministran dos gráficos, uno ilustrando el crecimiento en el número y el área de las áreas protegidas a través de los años (Figura 1) y el otro ilustrando el crecimiento del número y del área en períodos de cinco años (Figura 2). Se debe resaltar que el establecimiento del Parque Nacional Northeast Greenland (Northeast Greenland National Park) en 1974 (97 millones de hectáreas), el Parque Marino Great Barrier Reef (the Great Barrier Reef Marine Park) en 1979 (35 millones de hectáreas) y la Reserva Natural Jiang Tang (Jiang Tang Nature Reserve) en 1990 (24 millones de hectáreas) tienen un efecto significativo en los gráficos, ya que estos sitios son más grandes, al menos en un orden de magnitud, que la mayoría de los otros en la lista de las Naciones Unidas.

Biogeografía

Así como en los cuatro ediciones previas de la lista, cada una de las áreas ha sido ubicada dentro de una de las provincias biogeográficas definidas por Udvardy (1975), a pesar de que la provincia concerniente no se encuentre identificada en esta lista. De las 9.832* áreas protegidas que califican para ser incluidas en la Lista de las Naciones Unidas, se conoce la provincia de Udvardy en 8.562 de ellas. Los 1.270 sitios restantes corresponden a una cantidad de áreas marinas que no pueden ser clasificadas dentro del sistema de Udvardy. El sistema mundial de provincias biogeográficas definido por Udvardy para la UICN divide el mundo en ocho reinos, subdivididos en 193 provincias, siendo cada provincia caracterizada por uno de los catorce tipos de bioma. Esta información es utilizada para proveer un análisis bruto de la cantidad de áreas protegidas en términos de provincia y tipo de bioma.

La Tabla 1 presenta un resumen de la cobertura de áreas protegidas (número de sitios y área total) en cada uno de los reinos y provincias reconocidos por Udvardy. Aproximadamente 25% de las provincias biogeográficas parecen tener más del 10% de su área dentro de áreas protegidas. Sin embargo, al analizar estos datos se deben tener en cuenta una serie de limitaciones presentes en este sistema, las cuales surgen por la naturaleza bruta de los datos y por diferencias en tamaño entre las provincias. Por ejemplo, un área protegida de 5.000 hectáreas en la relativamente pequeña provincia de bosque espinoso de Madagascar (Malagasy Thorn Forest province) protegerá una sección mayor de dicha provincia que una reserva equivalente en tamaño en la enorme provincia Somalí (Somalian province). Varias provincias parecen tener una protección del 100% o más. Usualmente esto se debe a que están siendo incluidas áreas protegidas marinas, si bien la extensión de las provincias está basada en áreas terrestres solamente. Si bien los resultados son suficientes para ilustrar la cobertura por parches de las áreas protegidas, hace falta un análisis más detallado para determinar las necesidades reales y las prioridades.

La Tabla 2 presenta un resumen de la cobertura en áreas protegidas (número de sitios y área total) por tipo de bioma, indicando la proporción de cada tipo de bioma protegido dentro de cada reino. Esto fluctúa desde

porcentajes tan bajos como 0.69% en praderas templadas, hasta un poco menos de 10% en sistemas insulares mixtos.

Un resumen de la cobertura de áreas protegidas por bioma permite una primera aproximación de cuan adecuada es la protección dedicada a las mayores formaciones ecológicas, aunque por su puesto existe una variación considerable de protección dentro de los diferentes biomas. Es importante tener en cuenta que tipo de bioma no significa lo mismo que tipo de habitat. Un área protegida en un bosque húmedo tropical puede no contener bosque húmedo tropical, y un área que contenga bosque húmedo tropical puede presentarse en otro tipo de bioma completamente diferente, tal como un sistema insular mixto. Nótese en este sentido que Udvardy identifica toda Indonesia, Malasia Insular y las Filipinas como sistemas insulares mixtos, en lugar de como bosque húmedo tropical. Así mismo, tal como fue indicado en el caso de las provincias, es importante comprender que hay diferencias significativas entre las áreas cubiertas por biomas diferentes. Por ejemplo, en el Neotrópico hay áreas extensas cubiertas por bioma de bosque húmedo tropical (aproximadamente un cuarto del continente), pero sólo una pequeña área cubierta por el bioma de sistemas de lagos (El Lago Titicaca en la frontera Perú/Bolivia).

Resumen		
Categoría I	1.460	86'473.325
Categoría II	2.041	376'784.187
Categoría III	250	13'686.191
Categoría IV	3.808	308'314.011
Categoría V	2.273	141'091.932
Total	9.832	926'349.646

*En algunos casos, puede que un área protegida esté ubicada dentro de otra. En estas circunstancias, los totales pueden resultar exagerados. En el caso de los Estados Unidos, las áreas vírgenes de propiedad del Servicio de Parques Nacionales (National Park Service) y del Servicio de Peces y Vida Silvestre (Fish and Wildlife Service) han sido excluidos de los datos y del análisis debido a su gran tamaño.

World Heritage Sites

The *Convention Concerning the Protection of the World Cultural and Natural Heritage* was adopted in Paris in 1972, and came into force in December 1975. The Convention provides for the designation of areas of "outstanding universal value" as world heritage sites, with the principal aim of fostering international cooperation in safeguarding these important areas. Sites, which must be nominated by the signatory nation responsible, are evaluated for their world heritage quality before being declared by the World Heritage Committee. Only natural sites are considered here.

Article 2 of the World Heritage Convention considers as natural heritage: natural features consisting of physical and biological formations or groups of such formations, which are of outstanding universal value from the aesthetic or scientific point of view; geological or physiographical formations and precisely delineated areas which constitute the habitat of threatened species of animals and plants of outstanding universal value from the point of view of science or conservation; and natural sites or precisely delineated areas of outstanding universal value from the point of view of science, conservation or natural beauty. Criteria for inclusion in the List are published by Unesco.

Biens du patrimoine mondial

La *Convention concernant la protection du patrimoine mondial, culturel et naturel* a été adoptée à Paris en 1972 et est entrée en vigueur en décembre 1975. La Convention prévoit la désignation de régions de "valeur universelle exceptionnelle" en tant que biens du patrimoine mondial, dans le but premier d'encourager la coopération internationale pour la sauvegarde de ces régions importantes. Les sites, qui doivent être désignés par l'Etat signataire responsable, sont évalués en fonction de leur valeur pour le patrimoine mondial avant d'être acceptés par le Comité du patrimoine mondial. Nous ne tenons compte ici que des biens naturels.

L'article 2 de la Convention du patrimoine mondial considère comme patrimoine naturel: les monuments naturels constitués par des formations physiques et biologiques ou par des groupes de telles formations, qui ont une valeur universelle exceptionnelle du point de vue esthétique ou scientifique; les formations géologiques et physiographiques et les zones strictement délimitées constituant l'habitat d'espèces animales et végétales menacées, qui ont une valeur universelle exceptionnelle du point de vue de la science ou de la conservation; les sites naturels ou les zones naturelles strictement délimitées, qui ont une valeur universelle exceptionnelle pour la science, pour la conservation ou pour leur beauté naturelle. Les critères déterminant l'inscription sur la Liste sont publiés par l'UNESCO.

Sitios de Patrimonio Mundial

La *Convención sobre la Protección del Patrimonio Mundial, Cultural y Natural* fué adoptada en París en el año 1974, y entró en vigor en Diciembre de 1975. Esta convención estipula la designación de áreas de 'valor universal excepcional' como sitios de patrimonio mundial con el objetivo principal de fomentar la cooperación internacional para salvaguardar estas áreas. Estos sitios, los cuales deben ser nominados por los Estados signatarios responsables, son evaluados con relación a su valor como patrimonio mundial y declarados por el Comité de Patrimonio Mundial. Aquí sólo se considera sitios naturales.

El artículo 2 de la Convención de Patrimonio Mundial considera como patrimonio natural: áreas naturales que consisten de formaciones o grupos de formaciones biológicas y físicas, con un valor universal excepcional desde el punto de vista estético o científico; formaciones geológicas o fisiográficas que constituyen el hábitat de especies amenazadas de animales y de plantas de valor universal excepcional desde el punto de vista de la conservación o de la ciencia; y áreas naturales de valor universal excepcional desde el punto de vista de la ciencia, de la conservación o como bellezas naturales. Los criterios para inclusión en la Lista son publicados por la Unesco.

Biosphere Reserves

Réserves de la Biosphère

Reservas de la Biosfera

Biosphere Reserves

The establishment of biosphere reserves is not covered by a specific convention, but is part of an international scientific programme, the Unesco Man and the Biosphere (MAB) Programme. The objectives of the network of biosphere reserves, and the characteristics which biosphere reserves might display, are identified in various Unesco-MAB documents, including the Action Plan for Biosphere Reserves published in 1984.

Biosphere Reserves differ from the preceding types of site in that they are not exclusively designated to protect unique areas or important wetlands, but for a range of objectives which include research, monitoring, training and demonstration, as well as conservation roles. In most cases the human component is vital to the functioning of the biosphere reserve which does not necessarily hold for either World Heritage or Ramsar sites. A further fundamental difference is the stated aim of developing a biosphere reserve network representative of the world's ecosystems.

Réserves de la Biosphère

La création de réserves de la biosphère ne relève d'aucune convention mais entre dans le cadre d'un programme scientifique international, le Programme de l'UNESCO sur l'homme et la biosphère (Programme MAB). Les objectifs du réseau de réserves de la biosphère et les caractéristiques qui doivent être celle des réserves de la biosphère sont définis dans divers documents UNESCO-MAB, notamment le Plan d'action pour les réserves de la biosphère, publié en 1984.

Les réserves de la biosphère diffèrent des sites décrits précédemment en ce qu'elles ne sont pas exclusivement désignées afin de protéger des régions uniques ou des zones humides importantes mais pour toutes sortes d'autres raisons, notamment la recherche, la surveillance continue, la formation et la démonstration, sans oublier la conservation. Dans la plupart des cas, l'élément humain est vital pour le fonctionnement des réserves de la biosphère ce qui n'est pas nécessairement le cas pour les biens du patrimoine mondial ou les sites Ramsar. Autre différence fondamentale: un des objectifs fixés consiste à mettre sur pied un réseau de réserves de la biosphère représentatif des écosystèmes de la planète.

Reservas de la Biosfera

El establecimiento de reservas de la biosfera no está cubierto por ninguna convención específica, pero es parte de un programa científico internacional: el Programa de la UNESCO del Hombre y la Biosfera (MAB). Los objetivos de la red de reservas de la biosfera, y las características de las cuales que puede tener una reserva, se encuentran en varios documentos de la Unesco-MAB, entre los cuales se incluye el Plan de Acción para Reservas de la Biosfera publicado en 1984.

La diferencia fundamental entre las reservas de la biosfera y los tipos de sitios antes expuestos está en que estas no son designadas exclusivamente para proteger áreas únicas o humedales importantes, sino por una gama de objetivos, desde investigación, monitoreo, entrenamiento y demostración hasta conservación. En la mayoría de los casos el componente humano es vital para el funcionamiento de las reservas de la biosfera, lo cual no se aplica necesariamente ni en el caso de los sitios del Patrimonio Mundial o en los sitios Ramsar. Otra diferencia fundamental está en el objetivo manifiesto de desarrollar una red de reservas de la biosfera representativa de los ecosistemas del mundo.

Wetlands of International Importance (Ramsar Sites)

The *Convention on Wetlands of International Importance Especially as Waterfowl Habitat* was signed in Ramsar (Iran) in 1971, and came into force in December 1975. This Convention provides a framework for international cooperation for the conservation of wetland habitats. It places general obligations on contracting party states relating to the conservation of wetlands throughout their territories, with special obligations pertaining to those wetlands which have been designated to the List of Wetlands of International Importance.

Each State Party is obliged to list at least one site. Wetlands are defined by the convention as: areas of marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine waters, the depth of which at low tide does not exceed six metres.

Zones humides d'importance internationale (sites Ramsar)

La *Convention relative aux zones humides d'importance internationale, particulièrement comme habitats des oiseaux d'eau* a été signée à Ramsar (Iran), en 1971 et est entrée en vigueur en décembre 1975. Elle fournit un cadre à la coopération internationale pour la conservation des habitats contenus dans les zones humides. Les Parties contractantes à la Convention ont l'obligation générale de conserver les zones humides se trouvant sur leur territoire et, plus particulièrement, celles qui ont été inscrites sur la Liste des zones humides d'importance internationale.

Chaque Etat Partie a l'obligation d'inscrire au moins un site. La Convention définit les zones humides comme étant des étendues de marais, de fagnes, de tourbières ou d'eaux naturelles ou artificielles, permanentes ou temporaires, où l'eau est stagnante ou courante, douce, saumâtre ou salée, y compris des étendues d'eau marine dont la profondeur à marée basse n'excède pas six mètres.

Humedales de Importancia Internacional (sitios Ramsar)

La *Convención Relativa a los Humedales de Importancia Internacional Especialmente como Hábitat de Aves Acuáticas* fue firmada en Ramsar (Irán) en 1971 y se hizo vigente en Diciembre de 1975. Esta convención provee lineamentos de cooperación internacional para la conservación de humedales. Asigna obligaciones generales a los Estados contratantes con relación a la conservación de humedales a lo largo de sus territorios, con obligaciones especiales hacia aquellos humedales que han sido designados en la Lista de Humedales de Importancia Internacional.

Cada Estado está en la obligación de listar por lo menos un sitio. Los humedales están definidos por la convención como: extensiones de marismas, pantanos, turberas o aguas de régimen natural o artificial, permanentes o temporales, estancadas o corrientes, dulces, salobres o saladas, incluyendo las extensiones de agua marina cuya profundidad en marea baja no exceda de seis metros.

Anexo

Annex. 1994 Protected areas management categories¹

CATEGORY I **Strict Nature Reserve / Wilderness Area: protected area² managed mainly for science or wilderness protection**

CATEGORY Ia **Strict Nature Reserve: protected area managed mainly for science**

Definition Area of land and/or sea possessing some outstanding or representative ecosystems, geological or physiological features and/or species, available primarily for scientific research and/or environmental monitoring.

CATEGORY Ib **Wilderness Area: protected area managed mainly for wilderness protection**

Definition Large area of unmodified or slightly modified land, and/or sea, retaining its natural character and influence, without permanent or significant habitation, which is protected and managed so as to preserve its natural condition.

CATEGORY II **National Park: protected area managed mainly for ecosystem protection and recreation**

Definition Natural area of land and/or sea, designated to (a) protect the ecological integrity of one or more ecosystems for present and future generations, (b) exclude exploitation or occupation inimical to the purposes of designation of the area and (c) provide a foundation for spiritual, scientific, educational, recreational and visitor opportunities, all of which must be environmentally and culturally compatible.

CATEGORY III **Natural Monument: protected area managed mainly for conservation of specific natural features**

Definition Area containing one, or more, specific natural or natural/cultural feature which is of outstanding or unique value because of its inherent rarity, representative or aesthetic qualities or cultural significance.

CATEGORY IV **Habitat/Species Management Area: protected area managed mainly for conservation through management intervention**

Definition Area of land and/or sea subject to active intervention for management purposes so as to ensure the maintenance of habitats and/or to meet the requirements of specific species.

CATEGORY V **Protected Landscape/Seascape: protected area managed mainly for landscape/seascape conservation and recreation**

Definition Area of land, with coast and sea as appropriate, where the interaction of people and nature over time has produced an area of distinct character with significant aesthetic, ecological and/or cultural value, and often with high biological diversity. Safeguarding the integrity of this traditional interaction is vital to the protection, maintenance and evolution of such an area.

CATEGORY VI **Managed Resource Protected Area: protected area managed mainly for the sustainable use of natural ecosystems**

Definition Area containing predominantly unmodified natural systems, managed to ensure long term protection and maintenance of biological diversity, while providing at the same time a sustainable flow of natural products and services to meet community needs.

¹ For further information on the new management categories, readers should consult the *Guidelines for Protected Area Management Categories* (IUCN, 1994).

² A protected area is defined in the new *Guidelines for Protected Area Management Categories* as: *An area of land and/or sea especially dedicated to the protection and maintenance of biological diversity, and of natural and associated cultural resources, and managed through legal or other effective means.*

Annexe. Catégories de gestion des aires protégées (1994)¹

CATEGORIE I	Réserve naturelle intégrale /zone de nature sauvage: aire protégée² gérée principalement à des fins scientifiques ou de protection des ressources sauvages
CATEGORIE Ia	Réserve naturelle intégrale: aire protégée gérée principalement à des fins scientifiques
<i>Définition</i>	Espace terrestre et/ou marin comportant des écosystèmes, des caractéristiques géologiques ou physiologiques et/ou des espèces remarquables ou représentatives, géré principalement à des fins de recherche scientifique et/ou de surveillance continue de l'environnement.
CATEGORIE Ib	Zone de nature sauvage: aire protégée gérée principalement à des fins de protection des ressources sauvages
<i>Définition</i>	Vaste espace terrestre et/ou marin, intact ou peu modifié, ayant conservé son caractère et son influence naturels, dépourvu d'établissements permanents ou importants, protégé et géré aux fins de préserver son état naturel.
CATEGORIE II	Parc national: aire protégée gérée principalement dans le but de protéger les écosystèmes et à des fins récréatives
<i>Définition</i>	Zone naturelle, terrestre et/ou marine, désignée (a) pour protéger l'intégrité écologique dans un ou plusieurs écosystèmes dans l'intérêt des générations actuelles et futures, (b) pour exclure toute exploitation ou occupation incompatible avec les objectifs de la désignation et (c) à des fins spirituelles, scientifiques, éducatives, récréatives et touristiques, dans le respect du milieu naturel et de la culture des communautés locales.
CATEGORIE III	Monument naturel: aire protégée gérée principalement dans le but de préserver des éléments naturels spécifiques
<i>Définition</i>	Aire contenant un ou plusieurs éléments naturels ou naturels/culturels particuliers, d'importance exceptionnelle ou unique, méritant d'être protégée du fait de sa rareté, de sa représentativité, de ses qualités esthétiques ou de son importance culturelle intrinsèque.
CATEGORIE IV	Aire de gestion des habitats ou des espèces: aire protégée gérée principalement à des fins de conservation, avec intervention au niveau de la gestion
<i>Définition</i>	Aire terrestre et/ou marine faisant l'objet d'une intervention active au niveau de la gestion, de façon à garantir le maintien des habitats et/ou à satisfaire aux exigences d'espèces particulières.
CATEGORIE V	Paysage terrestre ou marin protégé: aire protégée gérée principalement dans le but d'assurer la conservation de paysages terrestres ou marins et à des fins récréatives
<i>Définition</i>	Zone terrestre, comprenant parfois le littoral et les eaux adjacentes, où l'interaction entre l'homme et la nature a, au fil du temps, modelé le paysage aux qualités esthétiques, écologiques et/ou culturelles particulières et exceptionnelles, et présentant souvent une grande diversité biologique. Préserver l'intégrité de cette interaction traditionnelle est essentiel à la protection, au maintien et à l'évolution d'une telle aire.
CATEGORIE VI	Aire protégée de ressources naturelles gérée: aire protégée gérée principalement à des fins d'utilisation durable des écosystèmes naturels
<i>Définition</i>	Aire contenant des systèmes naturels, en grande partie non modifiés, gérée aux fins d'assurer la protection et le maintien à long terme de la diversité biologique, tout en garantissant la durabilité des fonctions et produits naturels nécessaires au bien-être de la communauté.

¹ Pour tout renseignement complémentaire concernant les nouvelles catégories de gestion, le lecteur consultera les *Lignes directrices pour les catégories de gestion des aires protégées* (UICN, 1994).

² Les nouvelles *Lignes directrices pour les catégories de gestion des aires protégées* définissent une aire protégée comme étant: *Une portion de terre et/ou de mer vouée spécialement à la protection et au maintien de la diversité biologique, ainsi que des ressources naturelles et culturelles associées, et gérée par des moyens efficaces, juridiques ou autres.*

Anexo. Categorías de manejo de áreas protegidas¹ de 1994

CATEGORIA I	Reserva Natural Estricta /Area Natural Silvestre: área protegida² manejada principalmente con fines científicos o con fines de protección de la naturaleza.
CATEGORIA Ia	Reserva Natural Estricta: área protegida manejada principalmente con fines científicos.
<i>Definición</i>	Area terrestre y/o marina que posee ecosistemas, rasgos geológicos o fisiológicos y/o especies, destacados o representativos, destinada principalmente a actividades de investigación científica y/o monitoreo ambiental.
CATEGORIA Ib	Area Natural Silvestre: área protegida manejada principalmente con fines de protección de la naturaleza
<i>Definición</i>	Vasta superficie de tierra y/o mar no alterada o ligeramente alterada, que conserva su carácter e influencia natural, que no esté habitada de forma permanente o significativa, y la cual se protege y maneja para preservar su condición natural.
CATEGORIA II	Parque Nacional: área protegida manejada principalmente para la conservación de ecosistemas y con fines de recreación
<i>Definición</i>	Area terrestre y/o marina natural designada para a) proteger la integridad ecológica de uno o más ecosistemas para las generaciones actuales y futuras, b) excluir los tipos de explotación u ocupación que sean contrarios a los propósitos por los cuales fue designada el área, y c) proporcionar un marco para actividades espirituales, científicas, educativas, recreativas y turísticas, las cuales deben ser compatibles desde el punto de vista ecológico y cultural.
CATEGORIA III	Monumento Natural: área protegida manejada principalmente para la conservación de características naturales específicas
<i>Definición</i>	Area que contiene una o más características naturales o naturales/culturales específicas de valor destacado o excepcional por su rareza implícita, sus calidades representativas o estéticas o por su importancia cultural.
CATEGORIA IV	Area de Manejo de Hábitat/Especies: área protegida manejada principalmente para la conservación, con intervención a nivel de gestión
<i>Definición</i>	Area terrestre y/o marina sujeta a intervención activa con fines de manejo, para garantizar el mantenimiento de los hábitat y/o satisfacer las necesidades de determinadas especies.
CATEGORIA V	Paisaje Terrestre/Marino Protegido: área protegida manejada principalmente para la conservación de paisajes terrestres y marinos, con fines recreativos
<i>Definición</i>	Superficie de tierra, con costas y mares según sea el caso, en la cual las interacciones del ser humano con la naturaleza a lo largo de los años ha producido una zona de carácter propio con importantes valores estéticos, ecológicos y/o culturales, y que a menudo alberga una rica diversidad biológica. Salvaguardar la integridad de esta interacción tradicional es esencial para la protección, el mantenimiento y la evolución del área.
CATEGORIA VI	Area Protegida con Recursos Manejados: área protegida manejada principalmente para la utilización sustentable de los ecosistemas naturales
<i>Definición</i>	Area que contiene predominantemente sistemas naturales no modificados, que es objeto de actividades de manejo para garantizar la protección y el mantenimiento de la diversidad biológica a largo plazo, a la vez que proporciona un flujo sustentable de productos naturales y servicios para satisfacer las necesidades de las comunidades.

¹ Para mayor información de las nuevas categorías de manejo, los lectores deben consultar *las Directrices para las Categorías de Manejo de Areas Protegidas* (UICN, 1994)

² La definición de área protegida en *las Directrices para las Categorías de Manejo de Areas Protegidas* es: una superficie de tierra y/o mar especialmente consagrada a la protección y al mantenimiento de la diversidad biológica, así como a la protección de los recursos naturales y de los recursos culturales asociados, y que sea manejada a través de medios jurídicos u otros medios eficaces.
